1. Introduction

A bidding system is a structured method for participants to place competitive offers in auctions or procurement processes to win goods, services, or contracts. There are several contexts where bidding systems are applied, each with specific rules and structures, such as: Auction Bidding Systems, Procurement Bidding Systems, Online Ad Bidding (Programmatic Bidding), Bridge Bidding Systems etc. The online auction system is a web application where all products are displayed in different categories and a customer can bid for the selected category product without facing any problem [1]. The online auction system deals between sellers and bidders. It allows users to sign up for this application, search for products, and manage their accounts. Each customer will have their account showing the username they have logged in. On the other hand, users can also see all product pages without having access to their accounts. Signed-up users will have to log in first then they can upload products on the site from their account and also can bid for other products that are not owned by them. Users can edit their profile and see their uploaded products and bided products. The administration panel can approve products, update products, delete products, delete users, update and delete all ongoing bids, and can also see all the products, categories, users, and bids. All particular bids have limited time to finish. After finishing the bids admin can notify the sellers and also the bidders. This is a well-secured system and can be easily operated. This is fully dynamic. There is nothing static here. The main aim of this web application is to make a good online system that provides a great alternative to bidding policy for general people that saves both time and money.

2. Objectives

The project has the following objectives:

1. **Overview of the System:**

A bidding system allows users to register, log in, and place bids on listed items, with real-time updates. It manages bids, tracks user activity, and ensures fair competition through features like 'My Bid' to view individual bidding history.

2. **Enhance Process Efficiency:**

Automation minimizes human intervention, making the system faster, more efficient, and less prone to mistakes, ensuring smoother workflows.

3. **Improve Cost and Time Management:**

To reduce the time spent managing bids and ensure cost-effective bidding processes. By optimizing resource allocation, the system can reduce unnecessary expenses and ensure that time-sensitive bids are handled efficiently.

4. **Ensure Transparency and Fairness:**

To implement transparent procedures that ensure all bidders have equal access to information and opportunities.

5. **Measure System Performance and Impact:**

A clear overview helps stakeholders understand the system's scope and functionality, setting the context for the report.

6. **Enhance Bidder and Stakeholder Communication:**

To create an intuitive platform that improves communication between bidders and the management team. Clear communication channels and real-time updates can eliminate misunderstandings and facilitate better collaboration throughout the bidding cycle.

3. Methodology

Development of web based systems requires analysis of the process to be digitized in order to enable a correct system, a system that functions as required and to assist the potential users of the system understand the general functionality of the system. The analysis specifies the system's objectives and constraints to which designers have to comply. The purpose of doing analysis is to transform the system's major inputs into structured specification [2]. This has mainly two requirement section- Admin section and User section.

3.1. Requirement identification

This section divides the requirements into two main categories: the admin section and User Section. A review of existing systems, solutions, and academic literature informs the identified requirements, along with a discussion of limitations and gaps that the proposed project aims to address [3].

Admin Section Requirements:

1. Ability to create and manage user accounts with role-based access control (RBAC).
2. Admins can configure bids with deadlines, evaluation criteria, and templates.
3. Automated and manual scoring methods for evaluating bids based on predefined criteria.
4. Ensure data retention, audit trails, and legal compliance for transparency and accountability.
5. Automated notifications for key events like submissions, deadlines, and awards.

User Section Requirements:

1. Simple registration and bid submission process with support for document uploads.
2. Real-time tracking of bid status and feedback after evaluation.
3. Communication tools for bidders to ask questions and receive timely responses from the procurement team.
4. System optimization for mobile devices to ensure access across multiple platforms.

5. Intuitive interface design to enhance user experience and reduce the learning curve.
6. Existing systems offer robust features but tend to be complex and expensive, limiting adoption for small businesses.
7. Literature emphasizes the need for flexibility, but most solutions lack customization for SMEs.

The proposed system addresses these gaps by focusing on usability, mobile access, and scalability.

Previous online bidding platforms, like eBay, provide foundational features such as user registration, item listing, bid placement, and auction monitoring. However, they have limitations that our project aims to address. These include a lack of user customization options like personalized recommendations, delays in real-time feedback, complex seller workflows, and gaps in admin controls for fraud prevention and dispute resolution. Our project seeks to improve these areas by offering enhanced user experiences, instant notifications, simplified seller interfaces, and better admin monitoring. These improvements aim to create a more dynamic, user-friendly, and secure bidding platform.

3.1.1. Literature Review

The main goals of this system are to sell and bid different types of products to the customers living anywhere around Bangladesh. The website will show all products in categorized manner. Customers can browse any product and their details and can bid on the products. User has to get the order through the delivery policy. Admin can keep track of bids through admin panel. Online Auction System- Bidding System will be a web based application which main language of programming will be PHP. Its main aim is to simplify and improve the efficiency of the bidding process for users, minimize data entry and ensure data accuracy and security bid placement process. Users will also be able to view all product menus in categorized way with their full details. Users will also be able to have a visual confirmation that the order was place correctly [4].

3.1.2. Requirement Analysis

Each user type admin or user needs to register him or her as a user or an admin to access the user's necessary information. They also have email, username, and password. They can log in to the system from the web using their email and password.

1. Admin needs to log in to the system to operate the system. Admin has an individual or unique login email, password, and user level. Through this email and password admin can log into the system.
2. Admin can update all product pages. An admin can insert a new product with details and can update the product information through the edit option.
3. Admin can delete user from user panel. It can have the full access of user's bid list.
4. Admin can have access in the bid page.
5. Users can look for a product from a selected category.
6. User can add a product to the site with full details of that product.
7. They can see their products and bided list through their account page.
8. Users can edit their profiles.

3.2. Feasibility Study

The feasibility study assesses whether the proposed bidding system is viable and can be successfully implemented.

3.2.1. Technical

This subsection evaluates the technical capabilities required to develop the system. The study examines available technology stacks, database options, front-end and back-end frameworks, and hosting services. It ensures that the required tools and technologies are accessible and that the development team possesses the technical skills to build the system.

There are very few situations in which Biddings cannot be performed due to existing market conditions (e.g., in the case of a monopoly). It is more likely that the combination of different (legitimate) interests of the internally involved parties will lead to a situation in which a Bidding would seem inappropriate. By means of thorough and systematic preparation with all responsible internal parties involved, we help establish a framework in which a Bidding can be carried out, allowing the realization of the underlying savings potential. At the same time, we make sure that the company's main sourcing targets are reached. Many of our clients initially thought that commitment to the outcome of a Bidding would reduce their flexibility. They very soon concluded that systematic preparation only shifts the required flexibility to a position closer to the beginning. If a certain result is not to be supported, we make sure - by systematic preparation and careful Bidding design - that it will never occur

3.2.2. Operational

Operational feasibility evaluates how well the proposed system will fit into the existing environment. This analysis involves assessing user familiarity with similar systems, ease of use, and integration with other services like payment gateways, email notifications, and customer support.

3.2.3. Economic

Economic feasibility means the cost of understanding a project should be less than the existing system. this feasibility involves analyzing the cost-benefit structure of the project. Cost analysis is performed to determine the budget required for the development and operation of our bidding system. In this system, the project costs include software development (25,000 tk), hardware (8,000 tk), training (3,000 tk), and maintenance (1,500 tk), adding up to a total cost of 37,500 tk. The net benefit, after subtracting costs from the benefits, is 42,500 tk, showing that the project is financially worthwhile because the benefits exceed the costs. The following table shows the estimated costs.

Item	Description	Cost(tk)	Benefit(tk)
Development cost	Software Development	25000	-
Hardware cost	Servers & Equipment	8000	-
Training cost	Admin Training Session	3000	-
Maintenance cost	Annual Maintenance	1500	-
Total cost		37500	-
Increased Efficiency	Time saving	-	45000
Improved Admin Satisfaction	Admin Feedback	-	15000
Revenue Increase	New Customers	-	20000
Total Benefit		-	80000
Net Benefit		37500	42500

Figure 3.1: Sample Cost-Benefit Analysis of the Proposed Project

3.2.4. Schedule(Gantt chart showing the project timeline)

Timing is very important in a project from beginning to end. So we need to maintain our timing to do the project. We tried to keep the time to build the system from the beginning. We think the fixed time we planned was perfect for building the system. To build this system the most time we need to build the frontend and backend implementation. It was the toughest task to develop. Some of the tasks needed less time than we expected, and the rest time we used to improve the system. Below is the project timing:

Time Frame Of Our System	
	Estimated Time
Requirements Gathering and Analysis	1Weeks
System Design and Architecture	1Weeks
Database Development	2Weeks
Frontend and Backend Implementation	4Weeks
Testing and Quality Assurance	1Weeks
Deployment and Launch	1Weeks
Total	10Weeks

Figure 3.2: Sample Gantt Chart demonstrating schedule feasibility

3.3. High-Level Design of System

The proposed diagrams illustrate the structure and processes of an auction system:

- **Sequence Diagram** : Shows how the Buyer, Seller, Auction Manager, Auction, and Auction Item interact. The Seller starts an auction through the Auction Manager, which sets the Auction Item as "available" and tracks bids. After the auction ends, the Auction Manager updates the item's status and informs the Buyer to make payment.
- **Activity Diagram** : Outlines the steps in the auction process for both the Seller and Buyer. The Seller registers, lists items, and sets auction details, while the Buyer sets preferences, searches for auctions, and places bids. It also covers handling issues and finalizing the auction when a bid is accepted.
- **Use Case Diagram** : Shows what Sellers, Buyers, and Admins can do, like signing up, creating auctions, and placing bids. Admins also manage the system and handle reports.
- **ER Diagram** : Details the data structure, including Buyers, Suppliers, Products, and Admins. It maps out how these entities are connected, such as tracking bids and managing products, to keep the auction system organized.
- **DFD Diagram** : This auction system involves 'Users' (Customers and Clients), with Customers bidding and Clients hosting auctions. 'Admin' manages auction approvals, user blocking, and payments. 'Auction' tracks details, 'Bid' stores bid data, and 'Payment' handles transactions, ensuring smooth interactions throughout the system.
- **FlowChart** : The bidding system allows users to join as bidders or sellers. Bidders browse and place bids, while sellers create and monitor auctions. The system determines the highest bidder, sends notifications, and processes payments. Admins oversee operations, resolve disputes, and maintain the system, ensuring efficient and fair auctions.

3.3.1. Methodology of the proposed system

Sequence Diagram : The sequence diagram describes the flow of interactions in an auction system between the Buyer, Seller, Auction Manager, Auction, and Auction Item. The Seller starts by creating an auction through the Auction Manager, which relays the request to the Auction component. The Auction updates the Auction Item status to "available" for bidding. The Auction Manager then tracks incoming bids continuously until the auction's timer expires. When time runs out, the Auction Manager sends a message to close the auction and updates the Auction Item status (e.g., sold). Once a winner is determined, the Auction Manager notifies the Buyer, who makes the payment, completing the process. The Auction Manager acts as the central controller for handling all operations.

Figure 3.3: Sequence Diagram

Activity Diagram :The auction process involves two main actors: 'seller' and 'buyer'. The seller begins by registering as a participant, listing a product, and defining auction parameters like time and price constraints. The auction is then started, allowing buyers to join. The buyer configures preferences, searches for auctions, and checks product constraints before joining. Both parties exchange bids, with the seller receiving and responding to bids and the buyer sending their offers within set constraints. Exceptions are handled if any issues arise. Once a suitable bid is reached, the auction is finalized with price actualization, and settlement, and the auction is closed.

Figure 3.4: Activity Diagram

Usecase Diagram : This use case diagram represents the interactions between the Seller, Buyer, and Admin in an auction system. Both Sellers and Buyers can sign up, log in, browse the catalog, check bid status, predict the final price, and log out. Sellers can create auctions, bid for products, and report buyers, while Buyers can place bids. The auction process ends with a winner declared.

The Admin oversees the system by viewing buyer and seller details, viewing demographics, and taking actions on reported users. Key interactions involve bidding, auction creation, and the administration of user activity within the system. This diagram reflects the roles and responsibilities of each actor in managing and participating in auctions.

Figure 3.5: Use Case Diagram

ER Diagram : The described Entity-Relationship (ER) model outlines a bidding system where buyers, suppliers, products, and admins interact. Buyers have attributes like user_id, mobile, password, and status, and they place bids on products offered by suppliers. Suppliers manage products, which include attributes like pro_id, pro_title, pro_base_price, and pro_status. Admin oversees the creation and management of buyer and supplier accounts, ensuring system functionality. The Bid Product entity links buyers and products, recording each bid's bid_id, bid_pro_id, bid_buyer_name, and bid_price. The system captures and updates product status during bidding. The Supplier manages product details, while the Buyer places bids, and the Admin maintains account creation and system management, ensuring a structured auction process.

Figure 3.6: ER Diagram

DFD Diagram : This diagram represents an online auction system with several entities and their relationships. The 'Users' entity generalizes into 'Customer' and 'Client'. Customers can search for auctions and place bids, while Clients host auctions and track payments. The 'Auction' entity tracks auction details such as the name, start bid, last bid, category, and bid history. 'Admin' oversees the system, approving auctions, placing them live, blocking users, managing payments, and invoicing clients. The 'Bid' entity stores current and maximum bids, allowing for bid sorting. 'Payment' represents the financial transactions tied to auctions. This structure outlines how users interact with auctions, bids, and payments, with admins managing overall operations.

Figure 3.7: DFD Diagram

Flowchart : The bidding system enables users to participate in auctions as either bidders or sellers. After registration, bidders can browse auctions, place bids, and the system checks if their bid is the highest. Sellers create auctions, monitor them, and once the auction ends, the system declares the highest bidder as the winner. Notifications are sent to both the seller and the winning bidder, followed by payment processing and transaction completion. The admin oversees the system, ensuring smooth operations, resolving disputes, and managing system maintenance. This structure automates key processes, providing efficiency for users and ensuring fair auction outcomes.

Figure 3.8: Flowchart of the System

3.3.2. Description of Algorithms

The Overview of the Flowchart of the Bidding System A bidding system is a software platform that facilitates the buying and selling of goods or services through an auction/bidding format. Multiple users participate as either bidders or sellers, with system automation and an admin overseeing the process to ensure efficiency and compliance. Below is a breakdown of the system's components, actors, and processes.

User Registration Process:

1. Users must register on the system to participate, creating a unique account.
2. Upon registration, users can choose to act as either Bidders or Sellers.

Bidder Workflow:

1. Once registered as a bidder, users can view a list of ongoing auctions/bidding. These auctions display the items being auctioned, their descriptions, current bids, and the time remaining.
2. A bidder selects a specific auction and places a bid, entering an amount higher than the current highest bid.

Check Highest Bid:

1. If the bidder's amount is lower than the current highest bid, the system prompts the bidder to re-bid with a higher amount.
2. If the bidder's amount is higher, the system accepts the bid, updates the bid list, and marks the bidder as the current highest bidder.

Seller Workflow:

1. Registered sellers can initiate an auction by providing details such as the item's starting price, description, and auction duration.
2. Once the auction details are confirmed, the seller starts the auction, and the item is listed for bidders.

3. During the auction period, the seller can monitor the activity, viewing the bids as they are placed and checking the remaining time.
4. The auction automatically ends once the time expires.

Bidding Closure and Result Declaration Winner Declaration:

1. After the bidding time ends, the system automatically identifies the highest bidder and declares them the winner.
2. The seller is notified of the result, and feedback can be gathered from both the seller and the winning bidder regarding their experience.

Post-Bidding Process:

1. The system notifies the winning bidder of their success in the auction.
2. Payment is processed through the system, ensuring the buyer's payment is confirmed before proceeding to the next step.
3. Once payment is received, the transaction is marked as complete, and the item can be delivered or exchanged based on the seller's specifications.
4. The auction details and results are archived within the system for future reference and record-keeping.

Admin Role and System Oversight Monitoring and Control:

1. The admin ensures that all auctions run smoothly, preventing fraud and monitoring compliance with the platform's rules.
2. The admin can intervene in cases of disputes, fraudulent activities, or technical issues.
3. The admin also manages system maintenance, ensuring the platform functions properly, updating features, and troubleshooting errors when needed.

This structure ensures that both bidders and sellers have a seamless experience with minimal manual intervention. The system automates key processes, including bid checks, notifications, and auction closure, while the admin role provides oversight to guarantee fairness and efficiency

4. Expected Output

The expected output of a bidding system is a user-friendly platform for both buyers and sellers. Sellers should be able to easily register, list items for auction, set prices and time limits, and track bids in real-time. After the auction, the seller is notified of the highest bid and can complete the sale. Buyers should be able to browse auctions, set preferences, and place bids easily. They should get alerts if they are outbid and see updates on their bid status. After the auction, the system should help them with the payment and confirm their purchase. Admins should manage the system, handle disputes, and ensure everything runs smoothly. The system should be secure, fair, and accurate. It should also prevent any dishonest activities and allow users to report issues. There all the expected output are included with proper screenshots:

4.1. Homepage

Homepage: The homepage of the online bidding system is visually appealing and well-organized, designed to offer a seamless user experience. At the top "Login", and "Registration" sections are available. This page was made using Laravel (v11), PHP, database, CSS, HTML, and other necessary languages.fig[4.1]

Figure 4.1: Homepage

4.2. Registration & Login

Registration: At first user must need to register to login the my bid.

The screenshot shows a web browser window with the URL `localhost:127.0.0.1/building`. The page has a blue header with "Guest Dashboard" and "Home" links, and "Login Register" links on the right. The main content area is titled "Register" and contains a form with the following fields: Name (filled with "Sajia Rahman"), Email Address (filled with "sajia001@gmail.com"), Phone (filled with "01511111221"), Password (filled with "*****"), and Confirm Password (filled with "*****"). A blue "Register" button is at the bottom of the form. The Windows taskbar at the bottom shows the time as 3:11 PM on 10/16/2024.

Figure 4.2: Registration Page

Login Page: If any user or admin registers before he/she can log in by giving the email and password.

The screenshot shows a web browser window with the URL `localhost:127.0.0.1/building`. The page has a blue header with "Guest Dashboard" and "Home" links, and "Login Register" links on the right. The main content area is titled "Login" and contains a form with the following fields: Email Address (filled with "admin1@gmail.com") and Password (filled with "*****"). There is a checkbox labeled "Remember Me" which is checked. A blue "Login" button is at the bottom of the form. The Windows taskbar at the bottom shows the time as 2:58 PM on 10/16/2024.

Figure 4.3: Login Page

4.3. User

User Update : After successfully logging user gets the update message. Also in the sidebar users can see his/her profiles, update their profiles by changing information, and also able to change their own passwords. The user also can logout if he needs.

Figure 4.4: User Update Page

Old Info : All old information of users.

Figure 4.5: Befor Updating page

New Info : New information provided by users is automatically included and updated in the system, ensuring real-time accuracy.

Figure 4.6: user pass

Updated Page : New information provided by users is automatically included and updated in the system, ensuring real-time accuracy.

Figure 4.7: Updated

4.4. User Page

Seller Create Bid : Sellers need to request a bid by giving all information to create a new request.

The screenshot shows a web browser window with the URL `localhost:127.0.0.1/building`. The page title is "Building System". The navigation bar includes "User Dashboard", "Home", "Create Bid", "My Product", "Running Bid", "Won Bid", and "Sold Bid". The user's name "Jahed Hossain Tajek" is displayed in the top right corner. The main content area is titled "Create Bid Request" and contains the following fields:

- Product Name:
- Product Description:
- Bidding Price:
- Starting Bid:
- Ending Bid:
- Product Image:

A blue "Request Bid" button is located at the bottom of the form.

Figure 4.8: Seller create bid page

Create Bid Successfully : After creating a bid successfully, the seller is able to see a successful message to confirm

The screenshot shows the same web browser window as Figure 4.8, but with a green success message displayed at the top of the form: "Successfully Bid Request!". The form fields are now empty, and the "Request Bid" button is still present at the bottom.

Figure 4.9: Successful Message

Bid Waiting for Approve :Sellers can see their product list in "My Product" Option which has a delete option so that sellers can delete their bid product.

Figure 4.10: Bid Waiting for Approve Page

Running Bid List : Sellers can see other bid items in bid list as running bids.

Figure 4.11: User running

If bidder bids the lowest amount under the Requirement: Sellers get the update if he is lower than others.

Figure 4.12: User run bid4

Bidder Participate in a bid: A bidder participates in a bid by selecting an auction they are interested in and placing their offer or bid amount. They can monitor their bid status and respond to other bids in real-time. If they win, they are required to complete the payment as per the auction’s terms.

Figure 4.13: Bidder participate

Bid List: When a seller requests for his/her item for bid, he can see his/her own bid list. A page will display like these:

Bidup
My Bid List

Date: Sep 16, 2024

Product Name	Description	Starting Price	Ending price	Starting Date	Ending Date	Status	Image
samsung s11	original Vietnam version2	11000	No Bid	2024-09-17	2024-09-17	running	
Hp Laptop	Original Product	99999	Not start	2024-09-17	2024-09-17	Not Approve	

Thank you for visiting our website.

Figure 4.20: User list

Selling the Bid : After the bid is completed, the winner must make the payment; otherwise, the status will remain pending

The screenshot shows a web browser window with the URL `localhost:5272.0.1/bidding`. The page is titled "User Dashboard" and has a navigation bar with links: Home, Create Bid, My Product, Running Bid, Won Bid, and Sold Bid. The "Sold Bid" link is selected, and the user "Refatul Islam" is logged in. The main content area displays a table titled "Sold Bid" with columns: Bid ID, Product Name, Description, Starting Price, Ending Price, Starting Date, Ending Date, Image, Delivery Status, and Buyer Name. It lists one bid.

Bid ID	Product Name	Description	Starting Price	Ending Price	Starting Date	Ending Date	Image	Delivery Status	Buyer Name
1	iphone 15	apple	115000	117001	2024-09-11	2024-09-13		Pending	Md Hasan

Figure 4.21: Sold bid

Pending List : After completing the pending tasks, the admin approves the bid and proceeds with delivery.

Figure 4.27: Seller Information Listpdf

5. Conclusion

Our bidding system has successfully provided a streamlined and efficient platform for both buyers and sellers. By integrating features such as easy item listing, real-time bid tracking, and secure payment processing, the system meets the essential needs of its users. Sellers benefit from a straightforward process to list and manage their auctions, while buyers enjoy an intuitive interface to place bids and track their progress. The system also supports administrators in managing auctions, handling disputes, and ensuring overall system integrity. The current implementation has proven effective in enhancing user experience and facilitating increased transactions. However, there are several areas where future work can further improve the system. One potential area for development is the integration of advanced analytics and reporting tools. These tools could provide users with detailed insights into bidding patterns, market trends, and performance metrics, helping sellers optimize their auctions and buyers make more informed decisions. Expanding the system's capabilities to include mobile access and integration with other online platforms could also enhance its reach and usability. Mobile access would allow users to participate in auctions from anywhere, while integration with other platforms could drive more traffic to the system and increase user engagement. Overall, the bidding system is on a strong foundation, but ongoing improvements and updates will ensure it remains competitive and continues to meet the evolving needs of its users.
